

# 1 A note for Svar function in Matlab

Marco Aiolfi

SVAR verifies the identification conditions for a given structural form to be imposed on an estimated VAR model. The require inputs are the set of constraints to be placed on the elements of the A and B matrices so that

$$\begin{aligned}Vec(A) &= s_A \cdot \gamma_A + d_A \\Vec(B) &= s_B \cdot \gamma_B + d_B.\end{aligned}\tag{1}$$

Here is an example.

Consider a 2 variables VAR and suppose you want Choleski identification:

$$A = \begin{bmatrix} 1 & 0 \\ a_{21} & 1 \end{bmatrix}, B = \begin{bmatrix} b_{11} & 0 \\ 0 & b_{22} \end{bmatrix}.\tag{2}$$

Using 1 the constraints can be rewritten as follows:

$$\begin{bmatrix} 1 \\ a_{21} \\ 0 \\ 1 \end{bmatrix} = \begin{bmatrix} 0 \\ 1 \\ 0 \\ 0 \end{bmatrix} \cdot [a_{21}] + \begin{bmatrix} 1 \\ 0 \\ 0 \\ 1 \end{bmatrix}\tag{3}$$

$$\begin{bmatrix} b_{11} \\ 0 \\ 0 \\ b_{22} \end{bmatrix} = \begin{bmatrix} 1 & 0 \\ 0 & 0 \\ 0 & 0 \\ 0 & 1 \end{bmatrix} \cdot \begin{bmatrix} b_{11} \\ b_{22} \end{bmatrix} + \begin{bmatrix} 0 \\ 0 \\ 0 \\ 0 \end{bmatrix}.\tag{4}$$

After creating  $s_A, d_A, s_B, d_B$  the SVAR procedure is run with

```
[a,b,a_se,b_se]=svar1(results,sa,sb,da,db,afree,bfree)
```

where **results** is a VARE structure, **sa,sb,da,db**, are the constraints and **afree** and **bfree** are the number of free parameters in *A* and *B* matrices.

The demo file *svar.d.m* gives an example of SVAR procedure for a 5 variables VAR.

The interested reader can find details about identification and estimation of a structural VAR models in Amisano and Giannini (1997). A good reference for alternative identification schemes and their application to monetary policy analys is Favero (2000).
